SYPHILIS TREATMENT DURING PREGNANCY

Due to missed opportunities resulting in a significant number of cases of congenital syphilis in Alabama, ADPH is recommending the following treatment regimens, including retreating of women who were previously treated syphilis before pregnancy.

All pregnant women with signs and symptoms and/or a positive syphilis test result must be treated, as detailed below, **at least 30 days before delivery** to prevent congenital syphilis:

PRIMARY SYPHILIS, SECONDARY SYPHILIS, OR EARLY NON-PRIMARY AND NON-SECONDARY SYPHILIS:
Benzathine penicillin 2.4 million units IM every week for two weeks at 5-7 days interval.

SYPHILIS UNKNOWN DURATION, LATE SYPHILIS, OR PREVIOUSLY TREATED POSITIVE BEFORE PREGNANCY:
Benzathine penicillin 2.4 million units IM every week for three weeks at 5-7 days interval.

NOTE: Pregnant women with TRUE penicillin allergy should be desentized and treated with penicillin

*Please use the most current version of the CDC STD Treatment Guidelines if treating a case with neuro, ocular, otic, or other late clinical manifestations. For pregnant women requiring 3 doses of Bicillin, doses MUST be spaced exactly 7 days apart. Additionally, for pregnant women diagnosed within the first 12 months of their infection, some experts recommend a 2nd dose of Bicillin 7 days after the initial dose. For non-pregnant patients, doxycycline is an appropriate alternative therapy if patient is allergic to Bicillin. For cases infected less than 12 months ago, treatment is 100 mg doxycycline x 2/day for 14 days and for late or unknown duration syphilis, treatment is 100 mg doxycycline x 2/day for 28 days. Doxycycline is NEVER an appropriate therapy for pregnant women.
