

ALABAMA STD REPORTS QUARTERLY SURVEILLANCE REPORT DIVISION OF STD, BUREAU OF COMMUNICABLE DISEASE

Division of STD, Bureau of Communicable Disease • Alabama Department of Public Health
201 Monroe Street, Suite 1440, Montgomery, Alabama 36104 • (334) 206–5350

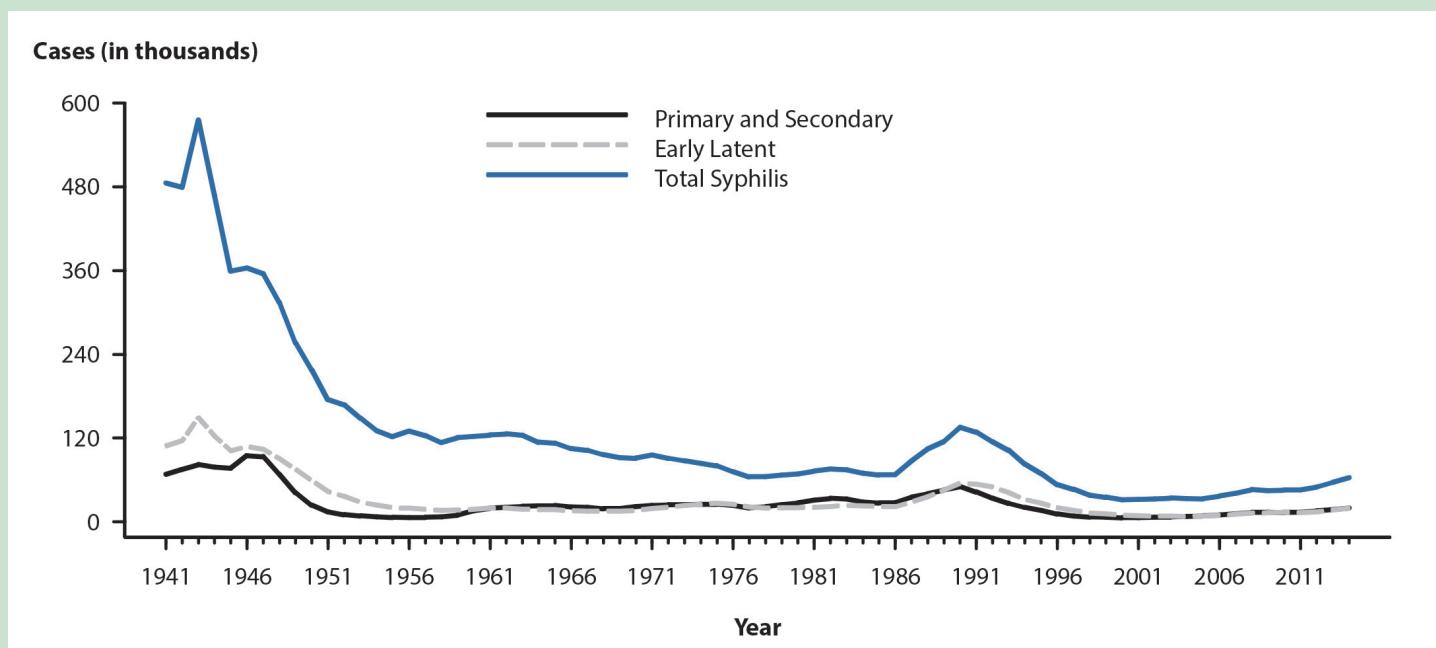

VOL. 2016, NO. 1

SYPHILIS TREND

Syphilis, a genital ulcerative disease caused by the bacterium *Treponema pallidum*, is associated with significant complications if left untreated and can facilitate the transmission and acquisition of HIV infection. Additionally, historical data demonstrate that untreated early syphilis in pregnant women may result in perinatal death of the infant in up to 40% of cases and, if acquired during the 4 years before pregnancy, can lead to infection of the fetus in 80% of cases.

In 2000 and 2001, the national rate of reported primary and secondary (P&S) syphilis cases was 2.1 cases per 100,000 population, the lowest rate since reporting began in 1941. However, the P&S syphilis rate has increased almost every year since 2000–2001. In 2014, a total of 19,999 P&S syphilis cases were reported, and the national P&S syphilis rate increased to 6.3 cases per 100,000 population, the highest rate reported since 1994.

Syphilis – Reported Cases by Stage of Infection, United States, 1947–2014

During 2000–2014, the rise in the P&S syphilis rate was primarily attributable to increased cases among men, specifically gay, bisexual, and other men who have sex with men (collectively referred to as MSM). However, during 2013–2014 the rate increased both among men (14.4%) and among women (22.7%). This increase among women is of particular concern because congenital syphilis cases tend to increase as the rate of P&S syphilis among women increases. During 2013–2014 the overall male and female P&S syphilis rates increased in every region of the country. Nationally, P&S syphilis rates increased in every age group 15–44 years of age in every race/ethnicity group except for Native Hawaiians/Other Pacific Islanders during 2013–2014. As in recent years, MSM accounted for the majority of P&S syphilis cases in 2014.

Nationally, the highest rates of P&S syphilis in 2014 were observed among men aged 20–24 years and 25–29 years, among men in the West and in the South and among black men in the West and South aged 20–29 years.

Syphilis, which can cause serious health problems if untreated, is on a troubling upswing across the United States. The rate of primary and secondary syphilis infections fell by nearly 90 percent between 1990 and 2000, but has increased most years since, according to a Centers for Disease Control and Prevention report analyzing public health data through 2013. This recent wave of syphilis is mostly a problem confronting gay men—or, to use the broader medical term, men who have sex with men. Between 2000 and 2004 alone, the CDC reports that the estimated proportion of primary and secondary syphilis infections attributable to men having sex with men rose dramatically, from 7 percent to 64 percent. Nationwide, the CDC reports that primary and secondary syphilis rates increased by 10 percent between 2012 and 2013—an infection rate more than twice as high as figures from 2001.

In Alabama, reported cases rose from 162 in 2014 to 277 in 2015. The state has seen an increase in Public Health Areas 2,3,4,8, and 11 (see Area map with list of program managers).

Syphilis, which can spread through sexual contact and also from a pregnant woman to her fetus, is easy to treat: antibiotics typically do the trick. But it is hard to detect and easy to spread because the early-stage symptom, a sore called a chancre, typically takes about three weeks to appear. Symptoms can also later disappear for a time, giving infected persons the false impression that they are clear of the disease. Its upswing in the United States has public health officials worried.

A decline in the use of condoms is one obvious culprit. The percentage of men who have sex with men estimated to have had unprotected anal sex within the previous 12 months rose from 48 percent in 2005 to 57 percent in 2011, according to the CDC. While it is clear that syphilis is spreading fast, especially among men having sex with men, public health and medical experts still don't know the answers to some really basic and important questions.

One theory is that the disease may be spreading in part because HIV-positive gay men are choosing to have unprotected sex with HIV-positive partners, a phenomenon called seroadaptation or serosorting. In one important respect this is a laudable risk-reduction strategy that can protect exposing HIV-negative people to HIV, but it can also put HIV-positive men at greater risk for STIs like syphilis. Many of the men having sex with men diagnosed with syphilis, CDC data indicate, are also HIV-positive.

A detailed description of each stage of syphilis can be found on CDC's syphilis fact sheet (<http://www.cdc.gov/std/syphilis/stdfact-syphilis.htm>).
<http://www.cdc.gov/std/syphilis/stdfact-syphilis.htm>

The Alabama STD Report: Vol. 2016, No. 1 represents preliminary statistics and trends of sexually transmitted diseases in Alabama from January 1 through December 30, 2015. All reports are presented by date of diagnosis. This report is intended as a reference document for local health departments, program managers, health care providers, community based organization, state legislators, researchers and others who are concerned with the public health implications of these diseases. The information in this quarterly report is meant to be brief and provide limited data on these diseases throughout the year. More detailed and complete information will continue to be available in annual publications. This report and our annual publications will be available on our website (<http://adph.org/std>). National data about these diseases is available on the Centers for Disease Control and Prevention's website (<http://cdc.gov>).

CHLAMYDIA SURVEILLANCE DATA

Chlamydia case reports represent persons who have a positive laboratory test for chlamydia. It is important to note that chlamydial infection is often asymptomatic in females and males. Most cases are detected through screening. The disease can cause serious complications in females including pelvic inflammatory disease. Asymptomatic infection is common among both men and women. Annual screening of all sexually active women ≤ 25 years of age is recommended, as is screening of older women with risk factors (e.g., those who have a new sex partner or multiple sex partners). Screening programs have been demonstrated to reduce both the prevalence of *C. trachomatis* infection and rates of pelvic inflammatory disease (PID) in women. The screening of sexually active young men should be considered in clinical settings with a high prevalence of chlamydia (e.g., adolescent clinics, correctional facilities and STD clinics).

GONORRHEA SURVEILLANCE DATA

Gonorrhea case reports represent persons who have a positive laboratory test for gonorrhea. The majority of urethral infections

caused by *N. gonorrhoeae* among men produce symptoms that cause them to seek curative treatment sooner to prevent serious sequelae, but treatment might not be soon enough to prevent transmission to others. Among women, gonococcal infections might not produce recognizable symptoms until complications (e.g., PID) have occurred. PID can result in tubal scarring that lead to infertility or ectopic pregnancy.

HIV AND AIDS SURVEILLANCE DATA

HIV case reports represent persons who have a confirmed diagnosis with human immunodeficiency virus (HIV) only. This represents all new diagnosis of HIV in Alabama regardless of the stage of the disease. Most persons are reported with only HIV infection, but some are reported with a concurrent diagnosis of AIDS (acquired immunodeficiency syndrome). HIV Stage 3 (AIDS) case reports represent persons with HIV infection who have progressed to AIDS. HIV infection and AIDS cases are presented in this report by date of diagnosis.

SYPHILIS SURVEILLANCE DATA

Syphilis reports are reported by stage of infection which is determined through a combination of laboratory testing, patient examination and interviews. Primary and secondary syphilis have specific signs and symptoms associated with them. Early latent syphilis is asymptomatic but can be staged with confirmation that the infection is less than a year old. Primary, secondary and early syphilis cases comprise "early syphilis" cases. Alabama conducts interviews on all early syphilis cases.

TRICHOMONIASIS SURVEILLANCE DATA

Trichomoniasis case reports represent persons who have a laboratory confirmed case of trichomoniasis infection. It is the most curable sexually transmitted disease. Trichomoniasis is often asymptomatic in females and males. The infection is more common in women than in men, and older women are more likely than younger women to be infected. Untreated trichomoniasis infection can increase the risk of HIV infection in men and women.

CENTER FOR DISEASE CONTROL AND PREVENTION TREATMENT GUIDELINES

Chlamydia: Azithromycin 1 g PO in a single dose or Doxycycline 100 mg PO twice a day for 7 days

Gonorrhea: Ceftriaxone 250 mg IM in a single dose PLUS Azithromycin 1 g PO in a single dose
or Ceftriaxone 250 mg IM in a single dose PLUS Doxycycline 100 mg PO twice a day for 7 days

If Ceftriaxone is not available: Cefixime 400mg orally in a single dose PLUS Azithromycin 1 g PO in a single dose

Syphilis: Early Syphilis – Bicillin 2.4 MU IM in a single dose

Late Syphilis – Bicillin 2.4 MU IM weekly for three consecutive weeks

Neuro Syphilis – Aqueous crystalline penicillin G 18-24 MU per day, divided into 3-4 MU IV every 4 hours or continuous infusion for 10-14 days

Trichomoniasis: Metronidazole 2 g PO in a single dose or Tinidazole 2 g PO in a single dose

CDC Treatment Guidelines: <http://www.cdc.gov/std/tg2015/toc.htm>

Total	511	574	291	247	147	85

Note: 2015 cases should be interpreted with extreme caution as not all reported cases have been entered into the HIV Surveillance database. Newly diagnosed HIV, non-AIDS includes newly diagnosed HIV infections not progressing to stage 3 (AIDS) within 30 days of diagnosis. Newly diagnosed HIV, stage 3 (AIDS) includes new and preexisting infections meeting criteria for stage 3 (AIDS) infection. Data accessed November 13, 2015.

HELP PREVENT CONGENITAL SYPHILIS

Test at first prenatal visit

Assess sexual risk behavior during pregnancy

Retest according to sexual risk behavior assessment

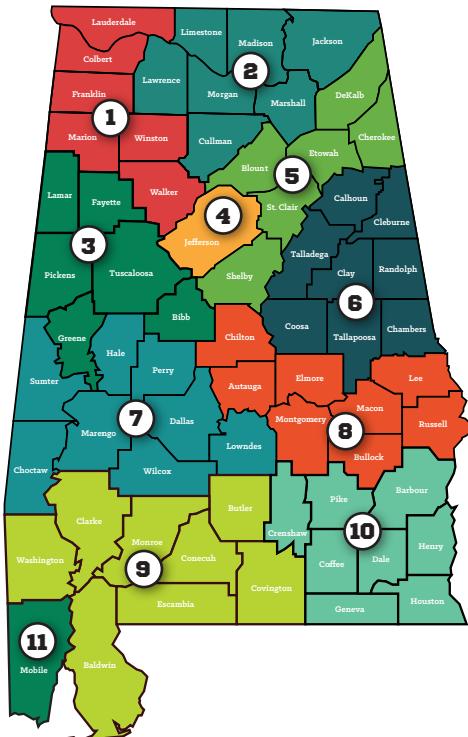

Treat pregnant females in accordance with CDC treatment guidelines

If you have any questions, contact the Alabama Department of Public Health, Division of Sexually Transmitted Disease at (334) 206-5350.

Note: Adequate treatment is defined as completion of a penicillin-based regimen, in accordance with CDC treatment guidelines, appropriate for stage of infection, initiated 30 or more days before delivery.

For pregnant women who have history of syphilis or tested positive for syphilis during pregnancy, follow up serologic titer must be monitored closely during the third trimester and repeat treatment 30 days or more before delivery.
